LP definitions rely on:

syntax transformations (reduct) + fixpoint constructions

Example: *M* is a stable model [Gelfond & Lifschitz 88] when "*M* is a classical minimal model of Π^{M} "

- A logical style definition: get minimal models inside some (monotonic) logic.
- Advantages:
 - Logically equivalent programs \Rightarrow same minimal models.
 - Full logical interpretation of connectives.

Stable models successfully identified

- (Monotonic) intermediate logic of *here-and-there* (*HT*) Classical \subseteq *HT* \subseteq Intuitionistic
- Pearce's *Equilibrium Logic*: minimal *HT* models Intuition: *t* world is fixed (plays the role of "reduct"), *h* world is minimized

Interesting results:

- Equilibrium models = stable models [Pearce 97]
- ► *HT* captures *strong equivalence* [Lifschitz, Pearce & Valverde 01] (we'll see later...)

A (10) > A (10) > A (10)

• Let *H*, *H'*, *T*, *T'* denote sets of atoms verified at *h*, *h'*, *t*, *t'*.

 A model can be seen as a pair (H, T) of 3-valued interp. where H = (H, H') and T = (T, T').

• Define an ordering among models, $\langle H_1, T_1 \rangle \trianglelefteq \langle H_2, T_2 \rangle$ if:

(i) $\mathbf{T}_1 = \mathbf{T}_2$ (this is fixed)

- (ii) H_1 less truth than H_2 ($H_1 \subseteq H_2$ and $H'_1 \subseteq H'_2$).
- $\langle \mathbf{H}, \mathbf{T} \rangle$ is said to be *total* if $\mathbf{H} = \mathbf{T}$.

Definition (Partial equilibrium model)

A model M of theory Π is a *partial equilibrium (PE) model* of Π if it is total and ⊴-minimal.

- Let *H*, *H'*, *T*, *T'* denote sets of atoms verified at *h*, *h'*, *t*, *t'*.
- A model can be seen as a pair (H, T) of 3-valued interp. where H = (H, H') and T = (T, T').
- Define an ordering among models, ⟨H₁, T₁⟩ ≤ ⟨H₂, T₂⟩ if:
 (i) T₁ = T₂ (this is fixed)
 (ii) H₁ less truth than H₂ (H₁ ⊆ H₂ and H'₁ ⊆ H'₂).
- $\langle \mathbf{H}, \mathbf{T} \rangle$ is said to be *total* if $\mathbf{H} = \mathbf{T}$.

Definition (Partial equilibrium model)

A model \mathcal{M} of theory Π is a *partial equilibrium (PE) model* of Π if it is total and \trianglelefteq -minimal.

- Let *H*, *H'*, *T*, *T'* denote sets of atoms verified at *h*, *h'*, *t*, *t'*.
- A model can be seen as a pair (H, T) of 3-valued interp. where H = (H, H') and T = (T, T').
- Define an ordering among models, ⟨H₁, T₁⟩ ⊴ ⟨H₂, T₂⟩ if:
 (i) T₁ = T₂ (this is fixed)
 (ii) H₁ less truth than H₂ (H₁ ⊆ H₂ and H'₁ ⊆ H'₂).
- $\langle \mathbf{H}, \mathbf{T} \rangle$ is said to be *total* if $\mathbf{H} = \mathbf{T}$.

Theorem (Corresp. to Partial Stable Models)

For a normal or disjunctive logic program Π , $\langle \mathbf{T}, \mathbf{T} \rangle$ is a partial equilibrium model of Π iff \mathbf{T} is a partial stable model of Π .

Among PE models of a theory Π we define :

- Well-Founded (WF) model: minimal information
- M-equilibrium model: maximal information
- L-equilibrium model: minimal set of undefined atoms

Theorem

For a disjunctive logic program Π , they respectively correspond to well-founded and to M-stable and L-stable models from [Eiter, Leone & Saccà 98].

H 16

• Nested expressions: nest $\land, \lor, \top, \bot, \neg$ in rule heads and bodies

- Quite common (for rule bodies) in Prolog. Example: a :- \+ (b; c, \+ (d, \+ e)). in logical notation $\neg(b \lor c \land \neg(d \land \neg e)) \rightarrow a$
- [Lifschitz,Tang,Turner99] (for stable models) NLP unfolded using 12 transformations, which include:

► Side switching for negation $F \land \neg \neg G \rightarrow H$ becomes $F \rightarrow H \lor \neg G$ $F \rightarrow G \lor \neg \neg H$ becomes $F \land \neg H \rightarrow G$

• What about PEL and WFS? Do they preserve these transformations? Yes, excepting side switching for negation.

Nested LP for WFS

When restricting to nested expr. in bodies, we obtain rules like:

 $p_1 \wedge \cdots \wedge p_n \wedge \neg q_1 \wedge \cdots \wedge \neg q_m \wedge \neg \neg r_1 \wedge \cdots \wedge \neg \neg r_t \to s_1 \vee \cdots \vee s_k$ (1)

That is, disjunctive LP with double negation in the body.

Theorem

Let Π be a disjunctive LP with double negation in the body. Let Π' be s.t. we replace each $\neg \neg c$ by $\neg \overline{c}$, plus a rule $\neg c \rightarrow \overline{c}$ per each new \overline{c} . Then Π and Π' are strongly equivalent modulo original alphabet.

Properties of PEL inference

• Entailment: $\Pi \vdash \varphi$ if either

- Π has PEL models and all of them satisfy φ or
- Π has not PEL models and φ is an HT^2 tautology

Theorem

PEL inference fails cautious monotony, truth by cases, conditionalisation, rationality and weak rationality. PEL inference satisfies reflexivity, cut, ∨ in the antecedent and modus tollens.

Properties of PEL inference

• Entailment: $\Pi \vdash \varphi$ if either

- Π has PEL models and all of them satisfy φ or
- Π has not PEL models and φ is an HT^2 tautology

Theorem

PEL inference fails cautious monotony, truth by cases, conditionalisation, rationality and weak rationality. PEL inference satisfies reflexivity, cut, \lor in the antecedent and modus tollens.

- SAT_{HT²} is NP-complete; VAL_{HT²} is coNP-complete
- Checking strong equivalence in PEL = VAL_{HT^2} = coNP-complete
- Existence of partial equilibrium models is Σ_2^P -hard
- The decision problem for equilibrium entailment is Π_2^P -hard

- *HT*² allows analysing which transformations are strongly equivalent
- We have analysed 8 typical transformations for disjunctive LP (see paper): TAUT, RED⁺, RED⁻, NONMIN, GPPE, WGPPE, CONTRA, S IMP.
- 3 of them are not sound in PEL (*GPPE*, S IMP, *CONTRA*).

Theorem

D-WFS (resp. STATIC) and PEL are non-comparable (neither stronger or weaker).

∃ ► < ∃ ►</p>

Translating PEL into Equilibrium Logic

- [Janhunen et al, ACM TOCL to appear] transformation: obtains partial stable models by translating program (atoms duplicated) and computing stable models
- We generalise this result to translate PEL arbitrary theories into Equilibrium Logic (see paper)

(The resulting translation of nested implications is not polynomial)

Summary

Partial Equilibrium Logic (PEL):

solid logical foundation for partial stable and well-founded semantics.

- Strong equivalence under several model classes (WF, M-stable, L-stable) captured.
- Pirst interpretation of nested expressions for WFS
- Complexity results similar to Equilibrium Logic
- Translation of PEL into Equilibrium logic
- Properties of PEL inference
- Analysis of transformation rules for disjunctive WFS

Why GPPE (unfolding) is not sound? Example:

 $a \lor b$ $\neg a \rightarrow a$ $a \land b \rightarrow c$

We get 2 PEL models, depending on $a \lor b$:

• When *a* is true, *b* and *c* become false

• When *b* is true, *a* gets undefined, and *c* too (it depends on *a*) After applying unfolding on atom *b* we get the program:

$$a \lor b$$

 $\neg a \rightarrow a$
 $a \rightarrow a \lor c$ (it's a tautology!)

that leaves c false in all PEL models

Cabalar, Odintsov, Pearce, Valverde
